

The ever-wet tropics

THE HOME OF:

A massive labyrinth of trees bushes and vines that houses billions of plants and animals.

THE TWO MOST DOMINANT...

Plants:

Orchids - trees that bear colourful and fragrant flowers.
Bromeliads - the shorter tree with eye-catching patterns.

Animals:

Monkeys - quick, agile inhabitant of the tropics.
Jaguars - a dangerous and fluffy predator.

HUMAN IMPACTS

The deforestation in rainforests leads to a loss of habitat for animals. This also means that as forest ecosystems collapse, animal species may become extinct. Climate change changes the rainfall patterns and changes the patterns in the distribution of species.
